

HortiFlush

The complete growing media conditioner.
Designed to help remove excess salts and dry-patches.
Restoring ideal growing conditions with natural biostimulation.

Attribute	Benefits
New generation organic wetting agent featuring advanced polymer chemistry	Polymers stick to growing media and draw water into dry spots giving full hydration
	Less water is required
Contains organic complexing agents to remove excess fertiliser salts	Helps maintain the electrical conductivity (E.C.) at a safe level
	Improves nutrients availability and uptake
Acidic formulation	Helps keep the pH at optimum values
	Releases locked-up fertilisers for improved uptake
Contains organic carbon as Humic and Fulvic acid	Natural complexing agents with biostimulant effect to boost plant growth and fruit quality
	Provides beneficial soil microbes with organic carbon to help them keep a healthy root system

HortiFlush aids the removal of excess salts and built-up deposits in growing media by the synergistic effect of its acidic components. Optimum electrical conductivity (E.C.) levels and pH are much easier to achieve with HortiFlush.

A new generation wetting agent improves the downward and lateral flow of water to provide a uniform moisture profile.

The organic complexing agents stimulate root growth and work as chemical “claws” that bind to the accumulated salts to produce an enhanced flushing effect.

The acidic formulation increases the solubility of accumulated salts and maintains the pH of growing media at optimum values for improved nutrient uptake.

Nutrient uptake and plant growth are boost by the biostimulant effect of Humic and Fulvic acids.

HortiFlush

The complete growing media conditioner.

Application protocol: HortiFlush should be used periodically in heavily fed crops with growing media with high E.C. levels. Use throughout the growing season when E.C. levels are higher than ideal. Always dilute in water and apply through the fertigation system. Ensure the product has fully dispersed before starting application.

Application rate (fertigation): Apply HortiFlush at 1ml/litre through the fertigation system. To achieve this prepare a stock tank with 10 litres HortiFlush per 100 litres of stock. Inject with the dosatron at 1:100 (1%) and apply to the growing media. Allow at least 30% run-off.

HortiFlush is available in 10 litre HFL233D, 20 Litre HFL233B
and 200 litre HFL223C Containers
